WARS
PORTFOLIO**
PAINTINGS BY
RALPH McQUARRIE

Ralph McQuarrie would never have guessed he would one day be doing space-fantasy artwork. Nonetheless, it was in his blood at a very early age. "It was part of my life ever since I was a little kid," he remarks. "I can remember drawings I did then of logging trucks with extra wheels and greater proportions, and fantastic versions of scientific equipment. So when George (Lucas) asked me to do these things, I felt it was what I was meant to do all along. It is the most fun and comes easy to me."

McQuarrie, born June 13, 1929, in Gary, Indiana, was influenced by his grandfather, who did watercolors, and his mother, who drew and painted. It wasn't long before he settled on a career in art. He took an art major in high school, studied technical illustration, and then went to work for the Boeing Company. There he met people who had studied at and recommended the Art Center School in Los Angeles. After two years in Korea, he enrolled at Art Center as an illustration student.

The ease with which McQuarrie understood the highly technical visuals required for STAR WARS is partially explained by his earlier work for CBS News Apollo coverage as well as for Boeing, Litton Industries, and Kaiser Graphics. His work for CBS, doing artist's renderings of the capsule's travel through space—making visible what could not otherwise be seen—generated quite an interest in McQuarrie's work. He was soon approached about doing animation background paintings and movie-poster art.

Some production paintings McQuarrie had done for Hal Barwood and Matthew Robbins brought him to the attention of director George Lucas in late 1975. Very soon after, they began discussing production paintings for STAR WARS. Lucas suggested that McQuarrie approach the work from the point of view of "ideal" portrayals rather than feel restricted by what could actually be achieved in filming the situations represented in the art.

The first four or five paintings had been done when STAR WARS was still in the development stage through Twentieth Century-Fox. George Lucas felt that McQuarrie's paintings would not only be of interest to Twentieth, but, by helping them to visualize his ideas, would also dissolve any hesitation on their part to go ahead with making the film.

The production paintings were of incalculable value when it came to discussing STAR WARS' production design and costuming. They reflect various changes in visual concepts as well as the evolving story line. The ideas of not only George Lucas and Ralph McQuarrie are concretized here, but also those of production designer John Barry and model designers Joe Johnston and Colin Cantwell.

McQuarrie's paintings were done in a combination of opaque gouache and acrylic on illustration board mounted on hardboard.

Luke is fighting Darth Vader in what was to have been a scuffle aboard the Rebel Blockade Runner soon after Vader's Imperials captured the Rebel ship. Luke is wearing a kind of breath mask because Vader's troopers apparently cut through a panel to get in, allowing the air supply to escape.

The Darth Vader costume—a grotesque breath mask and all sorts of other life-support systems, computer readout, black cape and armor—was partly inspired by the impressive image of a Samurai warrior. George Lucas, in keeping with the idea that Vader's whole being was to be mysterious, wanted the character to be entirely in black.

This painting represents R2-D2 and C-3PO first arriving on Tatooine after their narrow escape from the Imperial Stormtroopers via a Life Pod (which can be seen in the background). McQuarrie used a photograph of the Oregon coast to guide his painting of the landscape, following the line of the cliff and replacing the ocean with sand dunes.

C-3PO was inspired by the beautiful robot seen in Fritz Lang's classic silent film *Metropolis*, but Lucas wanted it to look more male than female. McQuarrie's C-3PO

looks much more graceful and slim than the 'droid was to become in the film. The problems of a person moving in all of that equipment made it necessary for C-3PO's body to be bigger and to have larger joints.

Lucas wanted R2-D2 to be like a small tripod which would move by throwing one leg outward and pitching itself forward like a man on crutches. But the problems of getting R2-D2 to move in that manner couldn't be solved, so he had to be made to glide forward or hobble about.

The Tusken Raiders, or Sandpeople as they are sometimes called, were conceived of as marginally human. They wear layers of clothing to protect themselves from the environment, and a moisture collector under the chin to sustain them as they roam the wastelands of Tatooine. These horribly vicious creatures and their Banthas are seen concealing themselves in the wreckage of some unfortunate spacecraft.

The Sandcrawler, a junk-collecting operation, is a very large and rusty old vehicle containing many storage rooms. McQuarrie envisioned a toothy front with a scoop that moved up and down like a present-day garbage truck. Lucas later came up with the magnet arrangement by which R2-D2 is taken into the behemoth vehicle. McQuarrie depicted the Sandcrawler against cliffs because the story, at this stage of its development, called for it to be hit by falling rocks, which knock it off track; during this commotion, the two robots were to have escaped. (The control devices which, in the film, restrain the robots, had not yet been conceived.)

Lucas described to McQuarrie the prospect from the cliff when the Mos Eisley spaceport is first in view. Luke Skywalker, clearly seen as a girl in the painting, was a girl at this point in the development of the story. C-3PO and R2-D2 can be seen behind a winged landspeeder. This elaborate vehicle became somewhat more streamlined in the film. The full bubble was retained, but was always kept open to a half-bubble for convenience in filming.

McQuarrie envisioned the Cantina as a primitive place framed by irregular archways and decorated with torn banners. It had a central gallery and a skylight over the bar. There wasn't much in it that would indicate that this was part of a society that had a lot of technical expertise. Lucas liked the feeling of it, but wanted occasional hints of mechanisms and technical sophistication, and McQuarrie added these effects to the painting.

The small balls which appear to be floating in the painting are called "seekers." The seeker eventually became the device for training Luke to use the lightsaber.

But in this painting, it was a kind of automatic police force programmed to dispense, in its cold fashion, the death sentence. It would float around until it found a person condemned by the Empire to die, then execute him.

Luke, in a bit of trouble with an unhappy alien, wears a costume much like the one Han Solo wears in the film.

The main characters are assembled here just prior to lift off at Mos Eisley. They are in costumes, KA-ing in the set. The Mos Eisley set, which houses Han Solo's *Millennium Falcon*, is quite a bit more serious-looking, with huge mechanical cranes that is in the film.

This painting establishes the massive proportions of the Death Star in relation to Han Solo's Corellian freighter, which is here seen being pulled into the Death Star hangar by a powerful magnetic tractor beam.

Copyright © 1997 Twentieth Century-Fox Film Corporation. All rights reserved.

McQuarrie explains this painting as a necessary compilation of elements—the ships and the big hangar in the Debris Air Casua. Figures are present merely to establish scale.

McQuarrie notes that this painting elaborates on a design which is basically what Barry's Barry made about a year before the set took on its final form.

Lucas wanted a row of elevators in the Death Star and McQuarrie made them individual tubes along one of the walls in the many deep canyons in the Death Star. There are a variety of robots, droids, and oddball characters here, as throughout the film, trying out the concept that the nature of a galactic civilization was that they adapted in a variety of modes to the various environments. The large spaces may have helped a circulation, but McQuarrie also speculates on the need for psychological space on such a space station.

Here, McQuarrie developed what was known as the "Last La Rue" scene in the depths of the Death Star. The retractable bridge and chasm—very much like and like Princess Leia's escape—were brought to life somewhere close to the center of the set. A series of lights were to radiate from a central point, ever widening circles.

Here we have an incipient confrontation as the small group of light ves try to escape the Imperial Stormtroopers. Chewbacca is carrying the Princess, a bearded Han Solo can be seen in an earlier costume design, a blue d. with a cape, and Luke is in the background. McQuarrie envisioned the hallway as being lit correctly through his lens. Defying standard principles, the light would radiate from these narrow spaces at 360 degrees, while the spots themselves would be detectable only from particular angles. It would be an attempt to the genius of these people that they discovered a key to the universe that permitted them to harness an incredible energy in this manner.

The beautiful, serene red planet Yavin 4 is seen from its lush moon, the stronghold of the Rebel Alliance. Another moon is seen in the distance. The bright emissions of distant starcraft are seen through the fog which surrounds this heavily jungled moon. The magnificent silver dome that joves the ground in this serene environment is a Rebel lookout.

Y-wing fighters are being unplugged from their ground system in the Rebel hangar at Massassi Field. Figure 4. The Rebel McQuarrie used a World War II photograph of a Navy plane running across the flight deck with a propeller in hand, capturing the untold story of capturing the gesture. The pilots have no doubt who are adaptive of life support working automatically whenever a malfunction in the aircraft occurs. The fighters are designs by Colin Cantwell, revised by Joe Johnson.

This painting provides the toping of the satir above the Jedi's Star from a enemy
 pilot's point of view.

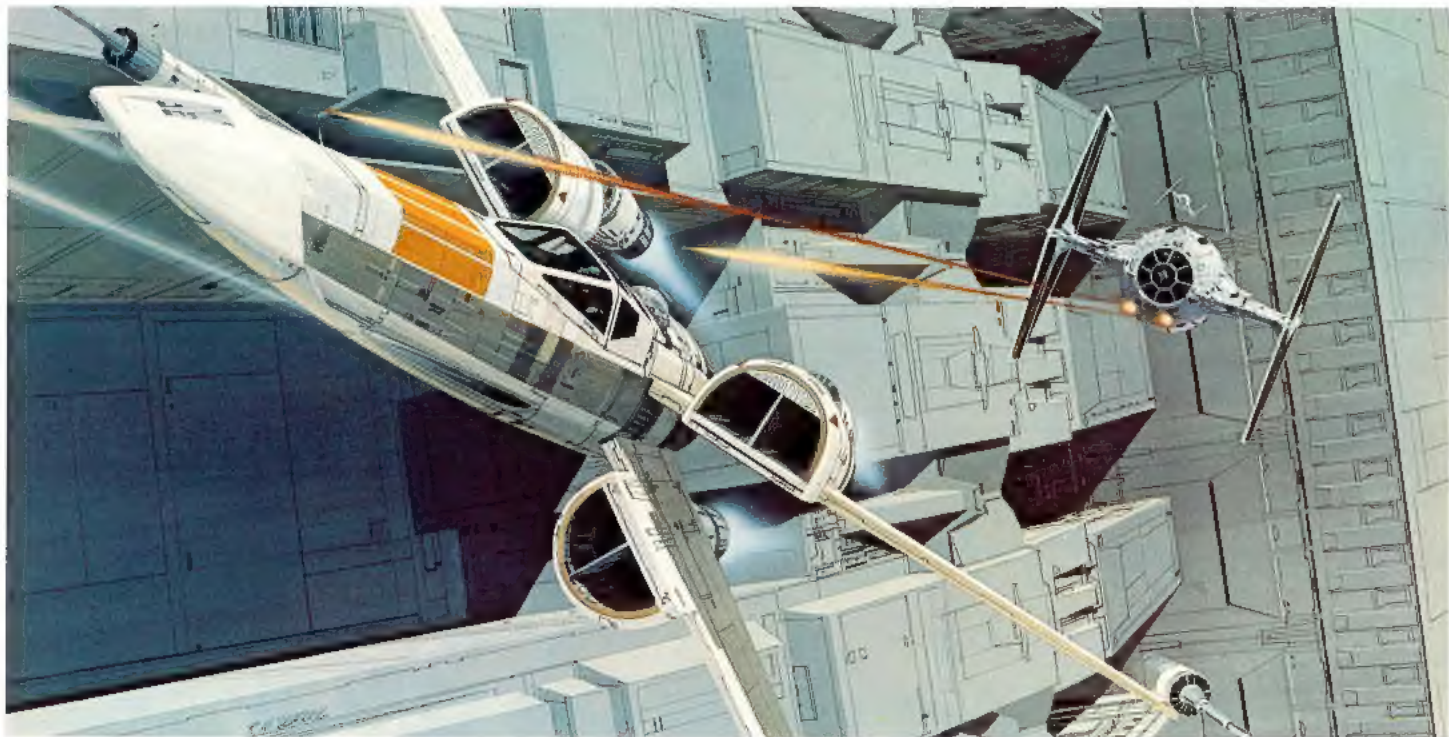

This targeting device in the cockpit was originally conceived by Mr. O'Quinn as being
 a radar location indicator register, which was behind and around the pilot's
 of sight. The pilot would rely on eye contact up front in the film, however, the
 device registered the target in front and did not show what was behind the pilot.

Left: Light Saber. Right: The Death Star. Star Wars: The Force Awakens. All rights reserved.

The main purpose of this painting was to capture the atmosphere of the battle over Takara's space station.

The open core appears as the Death Star structure represented McQuinn's concept of a laser cannon, a go-power source, accelerators and converters working all in one place. The core looks like a giant, glowing ball of fire, and the beam of light passing through the Death Star's structure is a metaphor for the power of the Force. The planet's surface is visible in the background, showing a blue and white landscape. The Death Star's complex, metallic structure is in the foreground, with various smaller spacecraft and debris floating around it.

George Lucas wanted to show the scale of the Death Star trench in relation to the fighters as an aid to the special effects people doing the miniatures.

Princess Leia honors those who saved the Rebel Alliance with an impressive ceremony at the Massassi stronghold. Ben Kenobi, who was originally still to be alive at the end of STAR WARS, can be discerned in the small group walking down the center aisle. McQuarrie felt the banners would be indicative of a royal atmosphere.

THESE ARE THE ASTONISHING PAINTINGS THAT HELPED BRING STAR WARS TO THE MOVIE SCREEN!

The mind-boggling imagination and graphic brilliance of artist Ralph McQuarrie captures all the excitement, energy and power of the film that has already thrilled millions--and is destined to be the movie phenomenon of all time.
